

# Cierzo

## Specifications

### Crop

Cucumber

### Market Segment

Greenhouse Continental

### Disease Resistance

High Resistance: Cca, Ccu

Intermediate Resistance: CVYV, CYSDV

### Hybrid

Yes

### Features

- Shoulder season type
- 30-35cm av. fruit size
- Vigorous plant with strong root system
- Good quality with dark green colour
- Improved disease package over Reko

## Specifications

### Description:

CIERZO is a mid late maturing shoulder season type to compare to Reko/Monjavo for sowing from spring into early summer in southern and western regions. The plant is vigorous with long generative lateral shoots, a strong root system and small leaf size which will assist air movement. The fruit of CIERZO are dark green in colour, averaging 30-35cm with good quality. Slightly later to mature than Reko, CIERZO has shown less susceptibility to Angular Leaf Spot compared to other non resistant commercially grown varieties in local field plantings.

*For a full definition of the disease terms, High Resistance and Intermediate Resistance refer to the product section on our website.*

The information provided is based on an average of data and observations collected from our trials. Significant variations may occur in the performance due to a range of conditions including cultural/management practices, climate, soil type and geographic location.
